Dimensions	854~869
Switch Installation, Standard Stroke	870
Custom Made	871

F CYLINDER

JKX Series

JKX

F CYLINDER

High Accuracy Actuator integrating Ball-Spline!

Ball Spline

THK Co., Ltd. LT

High-accuracy Ball Spline is adopted.

With Spigot Joint

Useful in locating

Lightweight and Compact

Example: JKX-SD12-15 106g

Ball Spline (light pre-loading)

By adoption of Spline Shaft for the rod and Ball Spline for the bearing, high accuracy, high rigidity, and high nonrotation accuracy are realized.

Air Cushion is Adopted

(JKX20~JKX40)

●Stroke Adjuster (option)

Stroke adjustment is possible both at push side and pull side of rod.

Special Rod Seal

The rod seal is developed to fit the shape of Spline Shaft.

Rod End

Three types of the rod end, flange rod end, male thread, and female thread are available as options.

Seal Shape

Summary of The F CYLINDER

The JKX Series, which is a result of change from the air cylinder-based to the guide-based concept, employs a mechanism that directly drives the high-accuracy ball spline itself. This structure allows the high accuracy of a ball spline to be fully brought out with a compact unit.

As with ordinary cylinders, it has a round shape and models can be manufactured to have a stroke in increments of 1 mm.

Also refer to the GXA Series with a square body (p. 947).

MASS

●Standard Type

Unit: g

Model	Standard Mass	Additional Mass
JKX12	100	0.4
JKX16	134	0.7
JKX20	270	1.1
JKX25	400	1.5
JKX32	440	1.8
JKX40	985	2.5

METHOD TO CALCULATE THE MASS

Ex. JKXS-SD20-100-ZTZES-RP12

Standard Mass..... 415g

Additional Mass..... $1.8 \times 100 = 180$ g

Flange Rod End..... 30g

Switch..... $35 \times 2 = 70$ g

$415 + 180 + 30 + 70 = 695$ g

●Push Stroke Adjuster Type (ZES, ZEL) Unit: g

Model	Standard Mass		Additional Mass
	ZES	ZEL	
JKX12	121	—	0.5
JKX16	150	—	0.9
JKX20	415	470	1.8
JKX25	570	650	2.4
JKX32	630	710	2.7
JKX40	1295	1395	4.1

●Pull Stroke Adjuster Type (ZFS, ZFL) Unit: g

Model	Standard Mass		Additional Mass
	ZFS	ZFL	
JKX12	—	—	—
JKX16	—	—	—
JKX20	315	325	1.1
JKX25	450	460	1.5
JKX32	495	505	1.8
JKX40	1075	1095	2.5

●Options

Unit: g

Model	With Bearing for Floating Mechanism (FN)	Flange Rod End (ZT)
JKX12	24	15
JKX16	30	17
JKX20	72	30
JKX25	92	50
JKX32	92	50
JKX40	250	85

●Switch

Unit: g

Switch Type	Mass
RP1, RP4, RP5	35
RP1LA, RP4LA, RP5LA	70

Mass of switch fixture is included.

JKX16	M5	17.9	5.1
JKX20	M6	24	8.6
JKX25	M8	26	22
JKX32	M8	29	22
JKX40	M10	39	43

MATTERS TO BE NOTED FOR DESIGNING

⚠ Caution

Rod End Deflection in case of Horizontal Use

Deflection is generated due to the load mounted at the rod end.

See the graphs on pages 848 for allowable load mass and deflection.

When the load length is long, the deflection at the load end is larger than that at the rod end.

In this case, read the deflection from the graph taking the length of the load length plus cylinder stroke as cylinder stroke.

Example: Cylinder Stroke.....100mm

Load Length.....50mm

Assuming $100+50=150$ mm as cylinder stroke,

read the deflection at the point (100+50)mm of cylinder stroke from the graph.

Moment Generated by Cylinder Thrust in case of Offset Contact

When a load/work is put into contact at an offset point from the rod as shown, a large moment is generated due to cylinder thrust.

Check the table of allowable moment in page 847.

$$\text{Moment} = \text{Cylinder thrust} \times L(\text{offset distance})$$

When an external force (lateral load) acts on the rod

In case where an external force (lateral load) acts temporarily on the rod end when the cylinder stopped, read deflection from the broken lines on the graphs

Rod Deflection

In case where a load is light, but the stroke is long, or a load at the rod end is large, the rod deflection may sometimes become unexpectedly large.

Select a model referring to the graphs of deflection.

Rod Vibration

In case where stroke is long, or load mass at the rod end is large, rod vibration may be generated at the cylinder push end.

Then, decrease the speed or select a model with a size larger dia. rod.

Also, when the rigidity of the base for mounting the cylinder is not sufficient, enhance the rigidity of the base.

Mounting of Load

When mounting a load by using a male or female thread at the rod end, set a spanner on the across flats of the rod to prevent the tightening torque from being applied to the bearing.

Cushion Needle Adjustment

The air cushion provided for JKX 20 to 40 is adjusted before shipping but can be adjusted by turning the needle according to the condition of use.

After adjustment, be sure to secure by tightening the lock nut.

If the cushion needle is opened too much, the air cushion does not function and excessive impact may be applied to the piston at the stroke end, causing damage or failure.

Rolling Feel in Bearing

The bearing (ball spline) of this product is slightly preloaded. Accordingly, when the rod is moved by hand, rolling of balls inside the bearing may cause slight feel of operation discontinuity or difference in the rolling resistance between products. This is due to preload of the bearing and does not affect the performance.

Stroke Adjustment of Push-out Adjustment Types (ZES and ZEL)

When adjusting the stroke, loosen the lock nut and turn the stopper for stroke adjustment.

When loosening the lock nut, set a spanner on the across flats of both the lock nut and the stopper for stroke adjustment.

Turning the stopper for stroke adjustment without loosening the lock nut causes the torque to be applied to the push-out adjustment rod as well, which may cause loosening of the connection between the rod and the piston, leading to failure.

After stroke adjustment, lock by setting a spanner on the across flats of both the lock nut and the stopper for stroke adjustment.

Use a spanner of an appropriate size.

Use of a monkey or pipe wrench may hinder correct adjustment, causing failure.

ALLOWABLE MOMENT

In case where a moment load is applied to the rod end

In case where the cylinder is operated under constant moment

Model	Allowable Moment N·m
JKX12	0.32
JKX16	0.40
JKX20	1.2
JKX25	1.5
JKX32	1.5
JKX40	4.7

In case where a moment is applied temporarily while the cylinder stopped

Model	Allowable Moment N·m
JKX12	0.98
JKX16	1.2
JKX20	3.1
JKX25	3.9
JKX32	3.9
JKX40	14

ALLOWABLE LOAD MASS, ALLOWABLE LATERAL LOAD AND ROD DEFLECTION

●Load Mass and Rod Deflection

In case of horizontal usage of the cylinder, deflection is generated in the rod due to the load mounted at the rod end. The relation between allowable load mass and deflection is shown in the graphs below. Applied load mass shall be within the range indicated by each solid line correspondent to each stroke length. (Please refer  page 845)

●Lateral Load Rod Deflection

Under the condition that the cylinder is stopped the relation between deflection due to an external force (lateral load) acting temporarily on the rod and allowable load mass is shown in the graphs below. Applied lateral load shall be smaller than the value indicated by each broken line correspondent to each stroke length. If an external force acts on constantly, see the values of allowable load mass in the graphs.

JKX12

Stroke (mm)	Allowable Load Mass (kg)	Allowable Lateral Load (N)
20	0.55	15
40	0.45	11
60	0.38	9.4
80	0.33	7.9

500	0.39	7.0
600	0.33	6.0

JKX40

Stroke (mm)	Allowable Load Mass (kg)	Allowable Lateral Load (N)
100	3.3	83
200	2.0	52
300	1.5	38
400	1.2	30
500	0.98	25
600	0.83	21
700	0.72	18

ALLOWABLE TORQUE AND TORSION ANGLE OF ROD

Torsion angle at the rod end when the rod is pushed out

- In case where the cylinder is operated under constant torque (dynamic allowable torque)
- when a torque is applied temporarily while the cylinder stopped (static allowable torque)

A torsional moment (torque) is generated when a load in eccentric condition is mounted at the rod end as shown below.
When the cylinder is operated in this condition, the torque shall be smaller than the value indicated by each solid line in the graphs below.

When a torque (T_0) is applied temporarily to the rod from outside while the cylinder stopped, the torque shall be smaller than the value indicated by each broken line in the graphs below.

$T=L \times W$
T: Torsional moment
L: Distance between the rod center and the center of gravity of a load
W: Load mass

JKX12

Dynamic Allowable Torque	Static Allowable Torque
0.13N·m	0.39N·m

JKX16

Dynamic Allowable Torque	Static Allowable Torque
0.25N·m	0.59N·m

JKX20

Dynamic Allowable Torque	Static Allowable Torque
0.50N·m	1.6N·m

JKX25

JKX32

Dynamic Allowable Torque	Static Allowable Torque
0.75N·m	2.2N·m

JKX40

Dynamic Allowable Torque	Static Allowable Torque
4.0N·m	6.9N·m

BEARING FOR FLOATING MECHANISM(option code FN)

●Prevention of damage when work installation fails

In case where work installation fails due to incomplete location, defective parts, etc. and the work is bumped, the floating mechanism will prevent the work from damage by absorbing the shock.

●Softening of impact force at work installation

In case where an impact force due to actuator velocity may cause breakage of work or defective assembling at work installation, the floating mechanism will prevent the work from such damage by softening the impact force and help to achieve smooth work installation and press fit.

●Work installation at different levels

In case where works are installed at the positions of different levels, only one actuator can perform the operation by setting floating stroke by level difference in advance.

●The bearing for floating mechanism incorporates the high precision and high, rigidity ball spline.

●Construction and Application Example

●As for the parts (parts marked * in the figure above) other than the bearing for floating mechanism, it is required to design and produce the construction and parts fitting with the machine at your side.

■MATTERS TO BE NOTED FOR DESIGNING

⚠Caution

①Specific resistance of Bearing

The bearing for floating mechanism has the specific resistance respectively. Pay attention to the setting load value of the spring. (The spring force shall be determined from a viewpoint of the mechanism as a whole)

Unit: N

Model	Specific Resistance	Model	Specific Resistance
JKX12	2.5	JKX25	4
JKX16	3	JKX32	4
JKX20	3.5	JKX40	5

②Direction of Bearing key groove and check mark

The check mark means the digit indicated in the optional place on the outside of the bearing. The digit are optional and mean nothing. When the bearing is mounted to the rod, insert straight so that the key groove of the bearing locates at the air inlet port side of actuator and the check mark at the body side of actuator. If it is inserted forcibly, the balls inside the bearing may come off.

③Tolerance of the housing inside dia. for the bearing

Generally, the tolerance between the bearing for floating mechanism and the housing shall be by transition fit (J6). In case where accuracy is not so required, it shall be by loose fit (H7).

Tolerance of Housing Inside Dia.	General Service Conditions	J6
	Accuracy is not required	H7

④Combination of the bearing and the rod

The bearing for floating mechanism and the rod are combinedly supplied. If other bearing, which is ordered additionally, attached to other actuator (including the part of the same specification), or purchased from somewhere afterward, is mounted to the rod, this may cause malfunction or poor accuracy. Be sure to use bearing attached to the actuator. The check mark (See clause 2 of this note.) on the bearing has nothing to do with the combination with rod. Even if the check mark on the bearing is the same, the combination of the bearing and the rod is another matter.

⑤Mounting of the bearing

The right figure shows a mounting example of the bearing for floating mechanism. Fixing strength in the axial direction is not so required, but only driving fit is not enough to hold and another measures shall be taken.

⑥Insertion of the bearing

When the bearing for floating mechanism is mounted, use a jig and not to tilt the cylinder to be parallel against the rod and insert carefully.

Model	di	D
JKX12	ϕ 5.0	13.5
JKX16	ϕ 7.0	15.5
JKX20	ϕ 8.5	20.5
JKX25, 32	ϕ 11.5	23.5
JKX32	ϕ 14.5	30.5

⑦Actual stroke of the actuator

The length of actuator stroke minus floating stroke is the stroke by which the work actually shifts. Be careful to select stroke.

DIMENSIONS OF ROD END WITH BEARING FOR FLOATING MECHANISM(Option code FN) —

Female Thread Rod End(KK)

JKX40	85	3.5	$\phi 16$	$\phi 31_{-0.013}^0$	M8x1.25depth13	17.5	50	0.5	2

Note 1. The rod projection length (mark A in the figure) is longer than the standard type. Pay attention to the overall length of the cylinder.

Note 2. JKX40 is different from the above figure for the groove shape of the rod spline.

See pages 854~869 for other detailed dimensions of the entire product.

Note 3. A bolt and a washer are attached at the female thread rod end (mark KK in the figure) to prevent the bearing from coming off when delivered. They shall be removed when the cylinder is used. (Adhesive is not used.)

INSTALLATION OF SWITCH

■ Switch Setting Position

RP1, 5 Switch

Unit: mm

Model	Switch Setting Position		On hold distance (ℓ)	Hysteresis (c)
	X	Y		
JKX12	9	5	7	2 or less
JKX16	14	5	8	
JKX20	7	6	9	
JKX25	7	6	9	
JKX32	7	6	8	
JKX40	11	13	9	

Note 1: In case of short stroke cylinder, the switch may not be turned off, or two switches may be turned on at the same time. Then, slide the switch outward from the position shown above.

Note 2: Since the values in the table are optimum, it is permitted to mount the switch apart a little from the point specified.

RP4 Switch

Unit: mm

Model	Switch Setting Position		On hold distance (ℓ)	Hysteresis (c)
	X	Y		
JKX12	7	3	3	2 or less
JKX16	12	3	3	
JKX20	5	4	2.5	
JKX25	5	4	3.5	
JKX32	5	4	3	
JKX40	9	11	3	

Explanation of hysteresis and on hold distance.  page 1084

■ Switch Installation

The switch can be moved freely in the axial or peripheral direction by loosening the fixing screw. Mount the switch at the adequate position checking the operation by the indicator lamp. The tightening torque of the fixing screw shall be 0.3N·m (3kgf·cm) max.

STANDARD STROKE

Bore Size	Stroke (mm)										
	15	25	30	45	50	60	75	100	150	200	250

φ16	○		○	○	○	○	○	○	—	—	—
φ20		○	○		○		○	○	○	○	○
φ25		○			○		○	○	○	○	○
φ32		○			○		○	○	○	○	○
φ40		○			○		○	○	○	○	○

Bore Size	Stroke (mm)									Maximum Stroke Available
	300	350	400	450	500	550	600	650	700	
φ12	—	—	—	—	—	—	—	—	—	100
φ16	—	—	—	—	—	—	—	—	—	100
φ20	○	○	○	○	○	○	—	—	—	550
φ25	○	○	○	○	○	○	○	○	—	650
φ32	○	○	○	○	○	○	○	○	—	650
φ40	○	○	○	○	○	○	○	○	○	700

Those marked with a circle are standard stroke models.

For the stroke, models can be manufactured to have a stroke in increments of 1 mm.  Range For JKX12 and 16, the minimum stroke is limited.  page 838

CUSTOM MADE

To each order, we will create a drawing of the product to be delivered based on the reference drawing shown below.
Contact us for the prices, how to order, time to delivery and detailed specification.

Hollow Rod Model.....Type with the hollow rods on both ends.

Optional.....With Stroke Adjustment Mechanism
With Bearing for Floating Mechanism
Rod End with Male/Female Thread

Application.....For Vacuum Suction, etc.

The rod and hollow diameters for respective models are as shown in the table below. (Unchangeable)

Unit: mm

Model	Spline Rod Diameter (D1)	Stroke Adjustment Rod Diameter (D2)	Spline Rod Hollow Diameter (d1)	Stroke Adjustment Rod Hollow Diameter (d2)	Piston Shaft Hollow Diameter (d3)
